Abstract

Modern commerce is changing due to the quick development of digital technology, artificial intelligence, e-commerce platforms, digital payments, and data-driven business models. These technologies raise ethical questions about consumer privacy, algorithmic bias, transparency, deceptive digital practices, data security, environmental sustainability, and digital inequality even though they offer increased convenience, market access, personalization, and operational efficiency. Future Ethical Commerce is a business strategy that combines technical innovation with social responsibility, fairness, accountability, transparency, customer welfare, and environmental sustainability. With an emphasis on artificial intelligence, customer data protection, transparent pricing, responsible digital marketing, sustainable e-commerce, inclusive digital markets, and responsible business practices, this review paper explores the new facets of ethical commerce. The study suggests an integrated framework where sustainability, ethical governance, technology, and consumer protection all function as interrelated elements. According to the survey, companies will need to reconcile technological innovation and profitability with stakeholder trust and responsible decision-making in order to conduct business in the future. Future ethical commerce is anticipated to have human oversight, explainable AI, responsible data governance, sustainable logistics, and strong consumer protection measures.

Keywords: Ethical Commerce, E-Commerce, Artificial Intelligence, Consumer Protection, Data Privacy, Sustainability, Digital Ethics, Responsible Business, Digital Trust

1. Introduction

E-commerce has increased market access, consumer choice, and convenience while allowing companies to connect with clients worldwide. The evolving nature of digital

commercial activity is reflected in the OECD's updated 2025 definition of e-commerce, which also acknowledges innovations like digital intermediaries, subscriptions, and AI-assisted transactions.

However, Customers are interacting more and more with algorithms that make product recommendations, set search ranks, customize ads, and affect consumer choices. Although AI can enhance customer experiences, consumers may be put at danger by opaque algorithms, biased results, intrusive data collecting, and deceptive digital designs. Fairness, accountability, and transparency are particularly highlighted by UN Trade and Development (UNCTAD) as critical concerns in the application of AI in consumer markets.

Another significant area is that of environmental sustainability. With growth in e-commerce, issues of packaging, transportation, warehousing, returns of products, energy usage, and e-waste become more relevant. UNCTAD has advocated sustainable packaging, greener logistics, circular business models, and transparency regarding environmental impact.
For this reason, the future of commerce cannot just be considered in terms of technology and financial gains. The question of whether there can be ethical digital commerce needs to be asked.

Goals of the Research

The study has the following goals:

1. To define the notion of future ethical commerce.
2. To assess the impact of artificial intelligence and technologies on ethical commerce.
3. To reveal key ethical challenges in digital commerce and e-commerce.
4. To reveal the importance of consumer privacy, transparency and data protection.
5. To assess the importance of sustainability and responsibility in future commerce.
6. To reveal challenges in implementation of ethical digital commerce.
7. To develop a framework for future ethical commerce.
8. To provide recommendations for future ethical digital business.

Methodology

In this study, the narrative review methodology is employed using a selection of academic literature and policy documents/reports pertaining to the issues of digital commerce, artificial intelligence, consumer protection, sustainability, and responsible business practices.

Major themes emerging from the literature include:

- Artificial intelligence and ethical decision-making
- Consumer privacy and data protection
- Transparency and algorithmic accountability
- Digital marketing and consumer autonomy
- Sustainable e-commerce
- Digital inclusion
- Responsible business practices
- Consumer protection
- Human oversight and governance

This is a conceptual paper, and does not entail any primary data collection via surveys, or experiments. This methodological approach aligns with that used in the uploaded model paper, which is essentially an assessment of literature within the context of applications.

Concept of Future Ethical Commerce

Future Ethical Commerce may be explained as follows:

The conduct of futuristic digital and business activities through technology-based innovation, while integrating the dimensions of fairness, transparency, accountability, consumer protection, social and environmental responsibility.

Ethical commerce involves more than just standard business ethics since technologies such as the Internet make it possible to affect consumers in ways that were never before feasible within the scope of conventional commerce.

The ethical commerce system of the future needs to take into account five critical issues:

Dimension	Key Question
Fairness	Are customers treated fairly?
Transparency	Can consumers understand important commercial decisions?
Privacy	Is consumer data collected and used responsibly?
Sustainability	Are environmental impacts minimised?
Accountability	Who is responsible when technology causes harm?

OECD's contribution in regard to digitalisation and responsible business conduct suggests that while digitalisation can be used as an instrument of achieving sustainability, it can create new avenues for potential human rights, social, and environmental abuses.\

5 Artificial Intelligence and Ethical Commerce

it is envisaged that artificial intelligence will be a major factor in future business dealings. AI could help with product suggestions, demand predictions, customer services, fraud detection, dynamic pricing, and marketing and personalized shopping.
AI-driven business practices, however, raise ethical questions.

5.1 Algorithmic Fairness

AI systems can generate varied outputs based on the data and algorithms employed in the process. This implies that there should be measures in place to help address such issues.

5.2 Explainability

Consumers or employees may require explanations for why certain recommendations, decisions or classifications have been made by the automatic system.

5.3 Responsible Personalisation

Personalisation enhances customer experience, but too much personalisation may limit the autonomy of consumers since consumers will be constantly targeted based on their behavioural information.

5.4 Human Oversight

AI must not take over from human accountability by default. Human oversight may be necessary for accountability in case automated systems face strange or ethical situations.

According to UNCTAD, AI can support the consumer protection process with the help of identifying the unethical practices of automation, at the same time raising risks of manipulation, discrimination and privacy.

6.Consumer Privacy and Data Ethics

Consumers' data has emerged as a valuable business asset. Electronic commerce websites gather consumer data related to searching, purchasing, preference, location, and interaction.

The following principles are crucial for ethical commerce in the future:

- Data minimization
- Purpose limitation
- Consumer consent
- Data security
- Transparency
- Responsible data sharing
- Consumer control over data
- Data retention and deletion policies

It is especially important to have consumer trust in electronic commerce markets. The four elements of consumer protection outlined by the Organisation for Economic Co-operation and Development (OECD) include privacy, information disclosure, payment protection and dispute resolution.

7. Transparency and Ethical Digital Marketing

Digital marketing offers organizations an opportunity to market products to customers in a personalized manner.

For future ethical business practices, we should promote:

Transparency in Advertising

It should be possible for consumers to differentiate between advertisement and regular content.

Truthful Product Information

Product descriptions, prices, and conditions should be communicated transparently.

Ethical Recommendation Algorithms

Recommendation systems should not take undue advantage of consumers' weaknesses.

Transparent Pricing

Information should be provided to consumers on crucial expenses, reductions, and other details before the completion of a transaction.

Prevention of Manipulative Digital Behaviour

Manipulative digital behaviour that makes it harder for consumers to turn down unwanted offers should be prevented.

The above topics become even more relevant because in the digital market, consumers may be influenced not only in terms of price and choice, but also concerning autonomy, privacy, and trust. Competition and Consumer Policy in the Digital Market is studied by the OECD in 2026.

8. Sustainable E-Commerce

Ethics in business involves taking environmental sustainability into account when making business decisions.

The following are ways e-commerce affects the environment:

- Packaging
- Transportation
- Warehouse operations
- Returns
- Energy use
- Electronic equipment
- Data centers
- E-waste

The UNCTAD Digital Economy Report 2024 identifies the environmental impact of digitisation and emphasizes the importance of circularity and responsible consumption, reuse, recycling, and sustainability in business models.

An ethical future e-commerce model would include:

Eco-Packaging -> Effective Logistics -> Less Returns -> Circular Products -> Recycling -> Responsible Consumption

Sustainable logistics can also be achieved using AI to optimize transportation paths.

9.Digital Inclusion and Social Responsibility

Ethical business must not cater to consumers who are equipped with broadband internet and technologically proficient.

Digital inclusion entails considerations for:

- Rural consumers
- Small businesses
- Consumers belonging to the elderly group
- Disabled consumers
- Less digitally skilled consumers
- Consumers with low income
- Small and medium enterprises

As pointed out by UNCTAD, disparities in digital technology, skills, resource base, and finance availability could make the participation of developing nations and firms in e-commerce and the broader digital economy difficult.

Thus, ethical commerce in the future must integrate digital innovation with access.

10.Integrated Framework for Ethical Future of Commerce

An integrated framework for a future ethical commerce model will have the following five layers:

Layer 1 - Digital Data

Data on the consumer, transactions, product, market and environmental conditions is collected.

Layer 2 – Intelligence Technologies

Artificial intelligence, machine learning, analytics, blockchain, cloud computing and automation process the data.

Layer 3 - Ethical Governance

Ethics principles such as fairness, transparency, privacy, accountability, and responsible data governance are adhered to.

Layer 4 – Sustainable and Inclusive Commerce

Sustainable and accessible products and services are considered by the business.

Layer 5 - Consumer and Stakeholder Outcomes

The end results include:

Trust + Fairness + Privacy + Sustainability + Value + Social Responsibility for Consumers

The process needs to be designed in such a way that there is a continuous feedback loop:

Consumers/Data Input → AI + Digital Processing → Ethics Governance → Business Decision → Consumer/Environment Impact → Measurement → Correction → Better Business Decision

It is consistent with the feedback-loop approach employed in the uploaded model.

11. Advantages of Future Ethical Trade

Consumer Confidence

A business that acts responsibly may build consumer trust.

Improved Consumer Protection

Use of ethical technology will aid in identifying any scams or other issues that affect consumers.

Business Sustainability

Business that is environmentally responsible will minimize wastage and resource usage.

Responsible Innovation

The use of ethical governance will enable companies to implement new technologies and consider its broader implications.

Long-term Business Relations

Trust, transparency, and responsibility may be part of business relations with stakeholders.

Digital Social Inclusion

Inclusive digital commerce can provide opportunities for consumers and businesses who previously could not access the market due to certain limitations.

12. Difficulties in Enacting Ethical Commerce

Despite its potential, there are still difficulties.

1. Lack of knowledge of digital ethics on the part of organizations and consumers.
2. Risks to data privacy that come from gathering too much data.
3. Bias in algorithms that make decisions automatically.
4. Lack of transparency in advanced AI technology.
5. Cybersecurity risks affecting consumers and businesses.
6. The risk of greenwashing through unverified claims concerning the environment.
7. Digital divide between different groups of people and regions.
8. Regulatory difficulties across countries and territories.
9. High costs of implementation for small businesses.
10. The difficulty of reconciling personalization and consumer autonomy.

OECD research makes similar statements about the importance of responsible business conduct because digitalization may pose new risks and create new opportunities for sustainable development.

13. Human Oversight Role

Technology must aid humans in taking responsibility for their actions within ethics-based business dealings.

These are some cases where human oversight becomes critical:

- When decisions taken by AI have significant consequences.
- When consumer grievances need to be interpreted.
- When algorithms produce results that cannot be expected.
- When sensitive personal data is involved.
- When environmental claims need to be confirmed.
- When automated decisions adversely impact vulnerable consumers.

It could be described as follows:

AI Offers Intelligence + Humans Offer Judgment + Governance Ensures Accountability

It is also in sync with the focus on human-in-the-loop decision making from the uploaded model.

14. Future Directions

Some of the directions in which future research and business may evolve are:

1. Ethical AI in e-commerce with respect to automated decision making.
2. Explainable AI to increase comprehension by consumers and managers.
3. Privacy-preserving techniques for ethical consumer data usage.
4. Consumer protection using AI to identify fraud, deception, and manipulation.
5. Sustainable e-commerce platforms, where environmental indicators are used in business decisions.
6. Green logistics and sustainable packaging to reduce the environmental impact of online businesses.
7. Digital product passports for enhanced information about the origin and lifecycle of products.
8. Circular commerce systems including reuse, repair, refurbishing and recycling.
9. Digital commerce systems that take into account different degrees of digital literacy and capability of consumers.
10. Human-AI cooperation with well-defined roles.
11. Ethical digital marketing that honours consumer autonomy.
12. Real-world empirical studies on the relationship between ethics, consumer trust, and business success.

The recently published work of UNCTAD highlights the need for environmentally sustainable e-commerce, better evidence, sustainable logistics, and cooperation of governments, business, and consumers.

15. Discussion

The future of commerce will probably depend on the combination of technology, business strategy, consumers, and policy. While AI and other technologies may help increase

efficiency, customization, and market presence, it is not enough to guarantee an ethical outcome through technology alone.

Ethics in commerce demand that the actions of businesses be analysed from different angles. For example, a recommendation of products may be effective from a commercial point of view but raises privacy issues. Rapid delivery of orders may be more satisfying for customers but may result in increased packaging and transportation effects.

For future business, it becomes necessary to have a balance where both technological development and the benefits of consumers, environment, society, and accountability are taken into consideration. The idea of ethical commerce, therefore, needs to shift from its existing narrow business ethics perspective to one of responsible digital value creation.

16. Conclusion

The Future of Ethical Commerce is a new way of doing business where technological advancements, commercial interests, and ethics all come together.

Technologies like artificial intelligence, e-commerce sites, payment systems, analytics and automation offer great possibilities for business and individuals. On the other hand, they present various ethical challenges related to privacy, transparency, algorithmic bias, individual agency, cybersecurity, sustainability, and digital inequality.

This is why the future ethics commerce system will be based on technology + ethics + consumer protection + sustainability + human responsibility.

If businesses adopt responsible data practices, transparent AI, sustainable logistics, ethical marketing, and digital inclusivity in the digital age, then they will have the potential of creating an ethical digital market. From the policymaking perspective, good consumer protection, responsible business practices, and international cooperation are still key. As stated by UNCTAD, today's work is focused on ensuring that digital transformation is sustainable. Therefore, future trade will not only be about digitalizing transactions but about making such transactions more responsible, transparent, inclusive, and sustainable.
